

The Hidden Lives of Female Apes

Melissa Emery Thompson
Research Assistant Professor
University of New Mexico
Department of Anthropology

There are reasons to believe that female apes, through shared heritage and common reproductive and social constraints, can provide essential information about the evolution of human female social interactions.

I will discuss the causes and consequences of subtle competitive and cooperative social relationships among females. I will also explore sexual conflict between males and females, emphasizing how new studies challenge overly simplistic models of selective and coercive behavior.

Bio Seminar: Friday, May 7, 2010
Science 3, Room 214, 4:00 PM

Presented by the EvoS Program
