

Childhood Experience and the Development of Reproductive Strategies: An Evolutionary Theory of Socialisation Revisited

**Jay Belsky • Institute for the
Study of Children, Families,
and Social Issues • Department
of Psychological Sciences
Birkbeck University of London**

An evolutionary theory of socialization recasts traditional views about environmental and rearing influences on child development in an evolutionary light, generating a prediction which differentiates the theory from previous prevailing theories - namely, that rearing experiences would shape somatic development as well as psychological and behavioral development. More specifically, stressful rearing environments would accelerate pubertal development.
